**Answer:**

Explanation

Resource to create in Azure: Dependency Agent
The Map feature in Azure Monitor for VMs gets its data from the
Microsoft Dependency agent. The Dependency agent relies on the
Log Analytics agent for its connection to Log Analytics. So
your system must have the Log Analytics agent installed and
configured with the Dependency agent.
Whether you enable Azure Monitor for VMs for a single Azure VM
or you use the at-scale deployment method, use the Azure VM
Dependency agent extension to install the agent as part of the
experience.
In a hybrid environment, you can download and install the
Dependency agent manually. If your VMs are hosted outside
Azure, use an automated deployment method
* Configuration to perform on the virtual machines: Enable
Virtual Machine Scale Set
* To set up Azure Monitor for VMs:
* Enable a single Azure VM or virtual machine scale set by
selecting Insights (preview) directly from the VM or virtual
machine scale set.
* Enable two or more Azure VMs and virtual machine scale sets

by using Azure Policy. This method ensures that on existing and new VMs and scale sets, the required dependencies are installed and properly configured. Noncompliant VMs and scale sets are reported, so you can decide whether to enable them and to remediate them.
* Enable two or more Azure VMs or virtual machine scale sets across a specified subscription or resource group by using PowerShell.
