Answer: B,C

NEW QUESTION: 3

Which weaknesses of Wyse thin client management software should you point out in a competitive situation? (Select three.)

- A. Wyse does not have an enterprise management tool comparable to HP Client Automation.
- B. Wyse Device Manager supports only the push mode of communication with the thin client gateway.
- C. Although the Workgroup edition of Wyse Device Manager is provided free of charge, Wyse charges for the Enterprise edition.
- D. Wyse charges for both the Workgroup edition and the Enterprise edition of Wyse Device Manager.
- E. Wyse Device Manager is a three-tiered solution, which increases the management complexity and adds to network traffic.
- F. Wyse does not have a mature and stable management tool, so it relies on third-party management solutions.

Answer: B,C,E

NEW QUESTION: 4

You have a computer that runs Windows 7.

Your network contains a DHCP server that runs Windows Server 2008 R2.

The server is configured as a Network Access Protection (NAP) enforcement point.

You need to configure the computer as a NAP client.

Which two actions should you perform? (Each correct answer presents a part of the solution. Choose two.)

- A. From the NAP Client Configuration console, enable the DHCP Quarantine Enforcement Client.

B. From Services, set the Netlogon service Startup Type to Automatic.

C. From the NAP Client Configuration console, configure the user interface settings.

D. From Services, set the Network Access Protection Agent service Startup Type to Automatic.

Answer: A,D

Explanation:

Network Access Protection

Network Access Protection (NAP) is a feature in Windows Server 2008 that controls access to network resources based on a client computer's identity and compliance with corporate governance policy. NAP allows network administrators to define granular levels of network access based on who a client is, the groups to which the client belongs, and the degree to which that client is compliant with corporate governance policy. If a client is not compliant, NAP provides a mechanism to automatically bring the client back into compliance and then dynamically increase its level of network access.

NAP Client Configuration

Network Access Protection (NAP), a new feature in Windows Vista and Windows Server 2008, allows you to control the access of client computers to network resources based on computer identity and compliance with corporate governance policy. To implement NAP, you must configure NAP settings on both servers and client computers.

There are three tools that you can use to configure NAP client settings:

*The NAP Client Configuration console provides a graphical user interface with which you can configure NAP client settings on the local computer or in a configuration file that you can save and apply to other computers.

*The Netsh commands for NAP client provide a command-line tool that you can use to configure client computers or to create a configuration file that you can save and apply to other computers.

*If you want to manage NAP client settings on domain member client computers, you can use the Group Policy Management Console and the Group Policy Management Editor. When you configure NAP client settings in Group Policy, these settings are applied on NAP-capable domain member client computers when Group Policy is refreshed.

Network Access Protection Agent

The Network Access Protection (NAP) agent service collects and manages health information for client computers on a network. Information collected by NAP agent is used to make sure that the client computer has the required software and settings. If a client computer is not compliant with health policy, it can be provided with restricted network access until its configuration is updated. Depending on the configuration of health policy, client computers might be automatically updated so that users quickly regain full network access without having

to manually update their computer.
