Explanation

Sprint retrospective meetings

The sprint retrospective meeting typically occurs on the last day of the sprint, after the sprint review meeting.

In this meeting, your team explores its execution of Scrum and what might need tweaking.

Based on discussions, your team might decide to change one or more processes to improve its own effectiveness, productivity, quality, and satisfaction. This meeting and the resulting improvements are critical to the agile principle of self-organization.

Look to address these areas during your team sprint retrospectives:

- \* Issues that affected your team's general effectiveness, productivity, and quality.

- \* Elements that impacted your team's overall satisfaction and project flow.

- \* What happened to cause incomplete backlog items? What actions will the team take to prevent these issues in the future?

## NEW QUESTION: 2

An organization is planning to host a Wordpress blog as well a Joomla CMS on a single instance launched with VPC. The organization wants to have separate domains for each application and assign them using Route 53. The organization may have about ten instances each with two applications as mentioned above.

While launching the instance, the organization configured two separate network interfaces (primary + ENI) and wanted to have two elastic IPs for that instance. It was suggested to use a public IP from AWS instead of an elastic IP as the number of elastic IPs is restricted.

What action will you recommend to the organization?

A. I agree with the suggestion but will prefer that the organization should use separate subnets with each ENI for different public IPs.

B. I agree with the suggestion and it is recommended to use a public IP from AWS since the organization is going to use DNS

with Route 53.

**C.** I do not agree as it is required to have only an elastic IP since an instance has more than one ENI and AWS does not assign a public IP to an instance with multiple ENIs.

**D.** I do not agree as AWS VPC does not attach a public IP to an ENI; so the user has to use only an elastic IP only.

**Answer: C**

Explanation:

Explanation/Reference:

Explanation:

A Virtual Private Cloud (VPC) is a virtual network dedicated to the user's AWS account. It enables the user to launch AWS resources into a virtual network that the user has defined. An Elastic Network Interface (ENI) is a virtual network interface that the user can attach to an instance in a VPC. The user can attach up to two ENIs with a single instance. However, AWS cannot assign a public IP when there are two ENIs attached to a single instance. It is recommended to assign an elastic IP in this scenario. If the organization wants more than 5 EIPs they can request AWS to increase the number.
