NEW QUESTION: 2
You are developing a .NET Core MVC application for customers to
research hotels. The application will use
Azure Search. The application will search the index by using
various criteria to locate documents related to
hotels. The index will include search fields for rate, a list
of amenities, and distance to the nearest airport.
The application must support the following scenarios for
specifying search criteria and organizing results:
* Search the index by using regular expressions.
* Organize results by counts for name-value pairs.
* List hotels within a specified distance to an airport and
that fall within a specific price range.
You need to configure the SearchParameters class.
Which properties should you configure? To answer, select the
appropriate options in the answer area.
NOTE Each correct selection is worth one point.

Answer:
Explanation:

Explanation

Box 1: QueryType
The SearchParameters.QueryType Property gets or sets a value
that specifies the syntax of the search query.
The default is 'simple'. Use 'full' if your query uses the
Lucene query syntax.
You can write queries against Azure Search based on the rich
Lucene Query Parser syntax for specialized
query forms: wildcard, fuzzy search, proximity search, regular
expressions are a few examples.
Box 2: Facets

The facets property gets or sets the list of facet expressions to apply to the search query. Each facet expression contains a field name, optionally followed by a comma-separated list of name:value pairs.
Box 3: Filter
The Filter property gets or sets the OData $filter expression to apply to the search query.
